

Ref.:372/AV

Rome, 03 December 2013

**RAC MED OPINION ON A BASIC STANDARDISED REGULATION
ON MARINE RECREATIONAL FISHERIES
IN THE EUROPEAN MEDITERRANEAN COUNTRIES**

The Executive Committee unanimously adopted the opinion proposed by the Recreational Fisheries Working Group 4 (RF WG) which convened on 12 November 2013 in Rome.

PRESENTATION

During the RAC MED Executive Committee (ExCom) meeting that took place in Thessalonica, 20th September 2010, the Big Game Italy representative proposed the establishment of a recreational fisheries work group (RF WG), the proposal was accepted.

On 23rd March 2011, the members present when the RF WG was formed, chose the representative of the Spanish association “Confederación Española de Pesca Recreativa Responsable” (CEPRR) as coordinator, he took this opportunity to request contributions from the members of RAC MED RF WG with experience in recreational fisheries management in the Mediterranean, these contributions should be gathered together and put to the service of RAC MED.

The scientific institutions need to develop a common and harmonized scientific monitoring protocol for recreational fisheries, implementing basic indicators to be assessed for each sector and each fishing method. To obtain these data, a common normative framework is necessary, so as to proceed according to the same approach and to standardise data characteristics.

In order to take full advantage of the work already completed in previous years, during the General Assembly held on 29th February 2012 the coordinator proposed the following reference study of Mediterranean recreational fishing as the basis for the work to be carried out:

GFCM STUDIES AND REVIEWS. RECREATIONAL FISHERIES IN THE MEDITERRANEAN COUNTRIES: A REVIEW OF EXISTING LEGAL FRAMEWORKS, No. 81 2007 By Charline Gaudin, Legal Assistant, and Cassandra De

Young, Fishery Planning Analyst, Development and Planning Service, FAO Fisheries and Aquaculture Department.

The proposal was accepted by the members of the WG and of the ExCom RACMED, the RF WG was requested to set the study in the context of the significant evolution of recreational fishing evolution in these last years.

Given the quality of the original text, the study in question has been respected as far as possible, although the context has been reduced to include just the European Mediterranean area in developing the proposal: "A BASIC STANDARDISED REGULATION OF MARINE RECREATIONAL FISHING IN THE EUROPEAN MEDITERRANEAN".

The RF WG have been kept in mind the recommendations of the CODE OF CONDUCT FOR RESPONSIBLE FISHERIES, FAO 1995 and TECHNICAL GUIDELINES FOR RESPONSIBLE FISHERIES, No. 13, FAO. 2012.

The coordinator highlighted that all the components of the 1/3 group members had provided a significant contribution to the contents of the document.

POSITION STATEMENTS

EAA (European Anglers Alliance) position statement:

EAA has worked on definitions for almost a decade. Our aim is to achieve fewer but very well-defined terms and terminology for recreational fisheries, which can find support in all European countries as well as globally. Our thinking is mainly directed by our own angling definition of 2004:

www.eaa-europe.eu/fileadmin/templates/eea/docs/DEFINITION-EAA_Angling_Def_long_FINAL_EN.pdf

- the EIFAC Code of Practice for Recreational Fisheries

<http://www.fao.org/docrep/012/i0363e/i0363e00.htm>

We have delivered this more detailed response to this RAC MED work on definitions (June, 29 2012):
http://www.pescaricreativa.org/docs/racmed/81_definitions_EAA_final.pdf

CEPRR and Big Game Italia (BGI) position statement:

CEPRR and BGI represent marine recreational fishing activities carried out from vessels, the positions expressed are conditioned by the opinion of the fishers represented. The CEPRR and BGI members have been working on the management of marine recreational fishing since the 1990s. In the context of the global recreational fisheries sector their members are a minority, but the socio-economic impact is significant, it is estimated that the European Mediterranean recreational fleet includes around 300 000 vessels.

Recreational fishing is not an isolated activity at sea. Marine recreational fishing carried out from vessels shares the same area and resources as the small-scale coastal commercial fishing fleet, this daily

2

coexistence should not be overlooked. Recreational fishing shares the same ports, fishing zones and some target species. In many cases retired commercial fishers also become recreational fishers for administrative purposes.

The recreational sector is not homogeneous, each sector and fishing method represents a sub-sector of global fisheries. Fishing from vessels, for example, has more in common with the artisanal fishing of the small-scale sector than with recreational underwater fishing.

The deep lack of knowledge that the commercial sector and fishery administrations has of the recreational sector is notorious, for this reason the RF WG members must make every effort to established detailed definitions to ensure full comprehension of these fisheries.

IFSUA (International Forum for Sustainable Underwater Activities) position statement:

IFSUA represents hundreds of thousands of practitioners of underwater activities all around Europe as well as many of the most important underwater equipment industries and specialized magazines of the world. Some of its members have been involved in recreational fishing management for several decades. Moreover, IFSUA has started important international, Mediterranean based, scientific cooperation projects in order to improve the knowledge of our seas. This has been due to the scientists' understanding that underwater activities community is the only sector that is objectively seeing what is going on down there.

IFSUA members are a part of the recreational fishing sector through the spearfishing community, but its interests go far beyond, as also our scuba-divers and underwater photographers are affected by how other recreational fisheries and commercial fisheries are managed.

Taking this into account IFSUA has approached the document with passion and understanding it not as a set of regulations, which in our opinion is out of our scope, but as a normative framework under which the EU and Member States can get stakeholders' point of view about how recreational fisheries should be managed. In some cases, together with the rest of the working group members, we consider that we have reached our aim, in others clearly not. In those cases we have tried to give our opinion through minority statements.

1 INTRODUCTION

Recreational fishing has been documented as one of the most popular activities along the coasts of numerous countries around the world, such as Canada, Italy, Spain and the United States of America (Sutinen and Johnston, 2003).

Moreover, it has been conceded that recreational fishing is a growing activity in the Mediterranean area. The development of tourism in various regions and the enhancement of tourism charter recreational fishing have contributed to the extension of recreational fishing to almost all EU Mediterranean countries.

This phenomenon has not come without raising concerns on the potential effects of such activities on fish stocks as well as interactions with commercial fishing activities. However, without proper analysis, it is not possible to identify the potential conflicts between recreational and commercial fisheries in the Mediterranean Sea.

The increasing importance of RF in Mediterranean waters in general and particularly in some areas, such as the Adriatic Sea, will oblige the countries (at national, sub regional, and basin-wide levels) to define sustainable policies and adopt adequate management measures, guaranteeing on one hand the benefits (e.g. economic, cultural, and social) generated by recreational fisheries while, on the other hand, protecting the marine resources from overfishing and other consequent negative impacts.

However, the importance of RF in the EU Mediterranean has been largely underestimated, whether it be from the point of view of its impact on marine resources or its socio-economic potential. This under-evaluation may stem, in part, from a lack of investigation into the values and impacts of RF.

As a result, at the time of this study, there was no concerted action for the sustainable development of RF at the Mediterranean level; neither were there clearly-defined national recreational fisheries policies within the EU Mediterranean countries. Spain and several other Mediterranean countries had, however, adopted comprehensive, or at least detailed, regulatory systems for recreational fisheries.

Although necessary, the existence of a legal framework alone is not sufficient to encourage the sustainable development of RF, particularly if the regulations are obsolete or irrelevant and enforcement is non-existent or inefficient. Mediterranean countries demonstrated a tendency to neglect the management of RF and particularly its monitoring and control for management purposes.

2. BACKGROUND

This chapter provides the context for recreational fisheries (RF) management in the EU Mediterranean countries, including international conventions and policy guidelines for RF, recommendations from the relevant regional fishery bodies (RFB), as well as regulations stemming from the European Commission, mandatory to a subset of the basin's countries and presents an overview of RF in the Mediterranean covering the following questions: what types of RF were practiced in the Mediterranean, which were the main RF-targeted species, what was known about the socioeconomic impacts of RF in the region, who were the primary stakeholders in RF management, what were the existing national policies guiding RF management and what RF legal frameworks were in place in the European Mediterranean countries.

2.1 INTERNATIONAL INITIATIVES GUIDING RECREATIONAL FISHERIES MANAGEMENT IN THE EUROPEAN MEDITERRANEAN

Adopted on 10th December 1982 and in force from 16 November 1994, the United Nations Convention on the Law of the Sea (UNCLOS) provided a new framework for the management of marine resources; creating new rights and responsibilities for the coastal states. More specifically, Article 61 on exclusive economic zones (EEZ) stated that a coastal state may take the appropriate measures of conservation and management in order to avoid overexploitation of marine living resources.

Furthermore, the coastal states, as well as the relevant international organizations may cooperate to that purpose. Given the extractive nature of RF, States should include RF in their attempts to conserve and sustainably manage their marine resources.

In March 1991, during its nineteenth session, the FAO Committee on Fisheries (COFI) called for the development of new concepts which would lead to responsible and sustainable fisheries activities. Based on the request formulated by the International Conference on Responsible Fishing held in Cancun (Mexico) in 1992, FAO prepared an international Code of Conduct for Responsible Fisheries (FAO, 1995), which was unanimously adopted on 31 October 1995 by the FAO Conference and which provided general principles and international standards of behaviour ensuring sustainable exploitation of living marine resources.

The Code has as its main objective to “establish principles and criteria for the elaboration and implementation of national policies for responsible conservation of fisheries resources and fisheries management and development” [CoC Article 2b]). The Code is voluntary and not legally binding, except regarding the articles based on relevant rules of international law, including those reflected in UNCLOS. The Code aims to provide a framework for national and international efforts to ensure sustainable exploitation of living marine resources, including not only targeted species but also the ecosystems on which they depend.

Although RF were not explicitly mentioned in the Code, the principles and standards of the Code are equally applicable to the conservation, management and development of all RF as with any other extractive fishing activities. According to the Code: “States and all those engaged in fisheries management should, through an appropriate policy, legal and institutional framework adopt measures for the long-term conservation and sustainable use of fisheries resources” (CoC Article 7.1.1).

Therefore, according to the Code, States should adopt RF regulations/measures preventing or eliminating excess RF fishing capacity as well as establishing effective mechanisms for fisheries monitoring, control and enforcement to ensure compliance with their conservation and management measures.

2.2 RECREATIONAL FISHERIES IN THE EUROPEAN MEDITERRANEAN CONTEXT

2.2.1. DEFINITIONS

Recreational Fishing:

Fishing activities, exploiting living marine aquatic resources for leisure, tourism or sport purposes, from which it is prohibited to sell or trade the catches obtained.

2.2.1.1 SECTORS

Leisure fishing:

Recreational fishing activities carried out as a hobby.

Tourism charter recreational fishing

Recreational fishing activities carried with a rented boat and a skipper or fishing guide on board.

Sport fishing:

Recreational fishing activities carried out with competitive intentions, within an established institutional framework which sets clear rules.

2.2.1.2 MODALITIES

Shore-based:

A recreational fishing activity practiced from the coast: beach, cliffs, piers or other man-made installations or by wading out into the sea.

Vessel-based:

A recreational fishing activity practiced from a vessel.

Shellfish harvesting:

A recreational fishing activity involving the gathering of crustaceans and molluscs from rocks and on beaches.

Spearfishing:

A recreational fishing activity carried out using free-diving techniques, without mechanical or respiratory assistance.

2.2.1.3. GEARS IN USE

Angling:

A recreational fishing activity practiced by rod and line or hand-held lines.

Traditional gears:

A recreational fishing activity practiced by nets, long lines, traps, pots and hand-held tools, used in specific situations and properly authorized by the competent administration.

Spearfishing:

A recreational fishing activity practiced underwater by free-diving techniques, with harpoons or by hand.

2.2.2 SPECIES IN MEDITERRANEAN RECREATIONAL FISHERIES

2.2.2.1 TARGET SPECIES

Recreational fisheries (RF) target species differ from one basin to another throughout the Mediterranean Sea. It is interesting to note that the species targeted by marine recreational fisheries do not always overlap with those species targeted by commercial fisheries in the area (i.e. sardines, anchovies, etc.).

The gastronomic culture in Mediterranean influences the choice of target species and therefore, in many cases, the species targeted by recreational fisheries coincide with those of commercial fisheries, especially those species which are historically recognized as part of the local culinary tradition and are thus highly valued from a gastronomic and consequently economic point of view.

In any case, we can state that the potential target species of marine recreational fisheries are those admitted by the GFCM for all fishing sectors.

TABLE 1 GFCM FAO SPECIES

2.2.2.2 PROTECTED SPECIES

The EU Mediterranean countries have adopted a list of protected species, the fishery of which is strictly prohibited due to biological and ecosystemic considerations. In the event of involuntary capture the fish should be released alive under the best survival conditions possible.

At EU level, the European Council Regulation 1627/2006 states in Article 3 that “the deliberate catching, retention on board, transshipment or landing of marine species referred to in Annex IV of Directive 92/43/CEE shall be prohibited”.

TABLE 2 PROTECTED MARINE SPECIES (BARCELONA CONVENTION)

2.2.2.3 SPECIES SUBJECTED TO A REBUILDING PROGRAMME

For species subject to rebuilding programmes, both nationally and/or internationally (e.g. Regional Fisheries Management Organizations – RFMOs – rebuilding programs, such as those set out by ICCAT), the rules must always be complied with. At international level, RFMOs (i.e. ICCAT) set rules that must be applied in all EU Member States.

2.2.2.4 THREATENED SPECIES

The marine recreational fishing of threatened species should be subject to specific regulations.

2.2.2.5 NON TARGET SPECIES

The capture of species that are not the target of the marine recreational fishing activity should be avoided. When these are accidentally captured, they should not be retained and they should be returned to the sea under the best survival conditions as possible in order to avoid a negative impact on the ecosystems.

2.2.2.6 BAIT FOR RECREATIONAL FISHING

In marine recreational fisheries, aquatic resources are often used as bait. These baits can be captured by the same recreational fisher or purchased in the markets supplied by the commercial sector. The use of exotic species as bait should be carefully avoided to limit the risks of allowing invasive species to spread.

2.2.3 SOCIO-ECONOMIC IMPACTS OF MEDITERRANEAN RECREATIONAL FISHERIES

2.2.3.1 AVAILABLE STUDIES:

At the time this document was prepared, very few qualitative or quantitative studies attempting to evaluate the socio-economic impacts of the marine recreational fishing with full or partial information on the Mediterranean existed:

BOX 1 SOCIO ECONOMIC STUDIES

Studies from other regions have shown, however, that marine recreational fishing may be an important source of income for various services sectors, such as creating employment in the tourism sector, recreational charter fishing, general services in harbours, fishing gear stores, as well as direct revenue in those sectors providing the economical inputs for naval industry, etc.

The value of the sub-sector needs to be understood and placed within the context of the fishing sector as a whole, in order to assist fisheries managers in correct allocation of the limited resources available, and to develop the fisheries management frameworks in the most efficient way.

However, according to Ditton (1998), research into socio-economic or human dimensions of recreational fisheries [in Europe] has elicited limited interest at management level, and in the USA and Canada these topics have been mainly limited to academic interest. In contrast, northern European countries began early on (1970) to analyse the economic value of RF for use in management.

Standard Marine Recreational fishing inputs for scientific studies must be defined.

BOX 2 (AS AN EXAMPLE): ECONOMIC VALUATION TECHNIQUES FOR RECREATIONAL FISHERIES

2.2.5 RECREATIONAL FISHERIES STAKEHOLDERS AND THEIR ROLE IN MANAGEMENT

Marine recreational fishing stakeholders, could include *inter alia*, 1) the public authorities at local, national and European levels in charge of fisheries management; 2) the associations and federations of recreational fishers; 3) the environmental associations; 4) the research institutes; 5) the representatives from the nautical recreational industry and services; 6) other users of the aquatic marine resources.

This list is by no means exhaustive and other organisms/stakeholders, such as other users of the aquatic resources and representatives from the secondary industries could be included.

In terms of fisheries management, the benefits of stakeholder participation in policy and management development are becoming generally accepted within the Mediterranean. But it has been acknowledged that in the Mediterranean there was a lack of stakeholder involvement in fisheries management and poor communication and information. RACMED will increase the involvement of the marine recreational fishing stakeholders in fisheries management.

Financing support is required to develop activities such as children's education, recreational fishers' behavioural education, technical consultation, legal consultation, scientific collaboration in biological studies and in human dimensions.

There are examples in various regions of the world of formal and informal bodies that have been created to encourage recreational fishery stakeholder participation in fisheries management. These generally include representatives from various stakeholder groups within well-defined mandates, such as promoting cooperation in surveillance and law enforcement, advising on social and economic initiatives, prioritizing and implementing data collection for management, addressing specific issues and other management functions.

2.2.6 RECREATIONAL FISHERIES POLICIES

According to the Article 7.1.1 of the FAO Code of Conduct for Responsible Fisheries (the Code), "states and all those engaged in fishery management should, through an appropriate policy, legal and institutional framework, adopt measures for the long-term conservation and sustainable use of fisheries resources" (FAO, 1995). The Code maintains that policies adopted by countries should have the objective of maintaining and restoring stocks by taking appropriate management measures based on the best scientific evidence available, as well as on relevant economic and environmental/ecosystem factors.

Measures taken should also provide for the conservation of the biodiversity of aquatic habitats and ecosystems, as well as the protection of endangered species. Such shifts away from production-based policies are equally valid for RF.

Furthermore, the European Commission, in a communication to the European Council and the European Parliament (COM (2002) 535 final), affirmed that “the large number of recreational fishermen, as well as the type and dimension of fishing gears used, justify the request to include this sector within fisheries management, both for reasons of conservation and fair application of management rules”.

Reference to the 2013 CFP Reform:

This consists of document 10629/13: Proposal for a Regulation of the European Parliament and of the Council on the Common Fisheries Policy, 12514/11 PECHÉ 187 CODEC 1166. COM (2011) 425 and, presented and approved in COREPER of 14th June, the Council proposed the following deliberation:

(2a), Recreational fisheries can have a significant impact on fish resources and Member States should ensure that they are conducted in a manner compatible with the objectives of the CFP

In the session of the Committee on Fisheries of the European Parliament of 18th June, this was approved by electronic vote; we have not verified the final text, but the Council included this reference to recreational fisheries. As a consequence, this it will be the only reference to recreational fisheries in the reform to the European COMMON FISHERIES POLICY.

2.2.7 LEGAL FRAMEWORKS

Fisheries administrations consider that such frameworks exist to manage the interests in which they are directly competent: those involving the primary extractive sector, shipping companies, shipbuilders, trade unions, fishers’ associations, etc.. Within this complex set of interests, marine recreational fisheries, with very few exceptions, are seen by the Mediterranean fisheries administrations as a marginal sector that does not create any concrete or quantifiable income.

Mediterranean recreational marine fishing is a sector that has historically been viewed with tolerance for social reasons, and which has contributed to the subsistence of many citizens, as well as several types of tolerated poaching.

When analysing the different regulations governing Mediterranean recreational marine fisheries, we emphasise that they have been established not so much to regulate the recreational sector, but to prevent interference with the commercial sector.

Fisheries policy is generally supported by a legal framework formalizing the processes to be followed to obtain the goals and objectives provided for in the policy. Legal frameworks often describe, *inter alia*, the rights and responsibilities of stakeholders, the institutional mechanisms related to the management of the fisheries resources, the management processes, the decision-making processes, the access regimes, and the monitoring and control mechanisms.

In some countries with comprehensive legal frameworks regulating marine recreational fisheries, several common elements were found, such as daily bag limits, gear restriction or sales bans.

In the cases where no legal framework existed for marine recreational fishing, some countries adopted specific decrees or executive orders, while others included the regulation within a general and comprehensive fisheries law; occasionally followed by subsequent orders or decrees specifying the application or execution of the recreational fisheries legislative provisions.

The Mediterranean offers a repertory of regulations that have to be simplified into one common set of rules that can be suitably adapted to each country or region.

3. MANAGEMENT MEASURES

According to Article 7.1.8 of the FAO code of responsible fishing, “states should take measures to prevent or eliminate excess fishing capacity and should ensure that levels of fishing effort are commensurate with the sustainable use of fishery resources as a means of ensuring the effectiveness of conservation and management measures”.

As recreational fisheries represent a major activity within the Mediterranean basin, countries have adopted legislation in order to regulate and to control the fishing effort by adopting access regimes, conservation measures and monitoring provisions.

The discussion in this chapter is organized to describe typical elements/provisions of RF legal frameworks and their formal definition in legislation throughout the basin, it includes:

- 1) The regulation of access to the resources
- 2) Conservation measures
- 3) Sanctions employed in case of infractions
- 4) Special instructions

3.1 ACCESS REGIMES

Under UNCLOS, the coastal states are in charge of regulating access to the marine resources within the waters submitted to their jurisdiction. The decline in fishing resources in many oceans and seas, and particularly in the Mediterranean, oblige coastal states to control access to the resources under their sovereignty.

In this study, the term “licence” covers concepts such as permit, authorization, certificate, *récépissé*, etc.

Definition of a Recreational Fishing License:

“A recreational fishing license is an administrative document giving permission to fish; it is free of charge and allows fisheries managers to have a reliable, up-to-date register of recreational fishers. It is also a tool to support scientific research”.

Thus defined, licencing can also be used in sampling for further surveys on biological and socio-economic data, collected from Mediterranean recreational fisheries, data with which decision makers can make the best management choices in favour of fish stock sustainability and the development of the economies of coastal communities.

3.1.1 CATEGORIES OF LICENSES/AUTHORIZATIONS

As marine recreational fisheries may be considered a growing activity in the Mediterranean, the application of a licensing systems is a necessary first step towards understanding the contribution of these fisheries to the region's economies, the impact on the resources and as a consequence the most appropriate management regimes. Vessel licensing is fundamental to acquire knowledge on the recreational fishing fleet of each basin, region and EU country.

3.1.1.1 INDIVIDUAL RECREATIONAL FISHING LICENSES:

Shore-based

This license should be required to practice any kind of fishery activity with methods that are shore-based.

Shellfish harvesting

This license should be required to practice any kind of shellfish harvesting.

Spearfishing

This license should be required to practice any kind of fishing activity that involves spear-fishing.

3.1.1.2 VESSEL BASED RECREATIONAL FISHING LICENSE:

This license should be required for any kind of recreational fishing that is practiced from a vessel.

3.1.1.3 TOURISM CHARTER RECREATIONAL FISHING LICENSE

From the point of view of fisheries administration, the recreational vessel-based license should be enough for the development of activities within the charter-tourism recreational fishing sector. Other such administrations, such as fiscal regulators, tourism, health, etc., may require further documentation in compliance with national legislation.

3.1.1.4 SPORT FISHING LICENSE

The fisheries administration should consider recreational fishing licenses sufficient for the development of activities within the sports fishing sector.

3.1.2 SPECIAL AUTHORIZATION/LICENSE

Under certain circumstances, special authorizations could be required, in addition to the generic RF licence, to fish species subject to specific conservation measures. The goal of such special authorizations is to increase controls by the relative administration.

Authorization/licences for species subjected to a rebuilding programme

Recreational fishers should be required to hold a special authorization to fish species subject to a rebuilding programme. (e.g. Regional Fisheries Management Organizations – RFMOs - rebuilding programmes such as those contemplated by ICCAT)

Authorization/licences for threatened species

Species-based licences could be appropriate for vulnerable species according to scientific advice.

Authorization/licences for historical reasons

In France, for historical reasons fishing for Bluefin tuna from an anchored boat requires special permission issued by the authority for Maritime Affairs.

Authorization/licences for use of traditional and passive gears

Recreational fishers should require special authorization for the use of traditional and passive gears.

Authorization/licences to fish in MPAs

Such licencing would be appropriate to manage fishing reserves.

3.1.3 DURATION OF LICENCES

The duration of a licence is one of the basic elements related to the document issued to recreational fishers and should be set according the data collection requirements. Permanent licenses should not be issued because the owner, at any time and for any reason, could cease the activity without any information being forwarded to the issuing administration.

3.1.4 LICENSE FEES

Recreational fishing licenses should be free of charge. When a fee is applied the revenue should be spent for RF management.

3.1.5 LICENCE TRANSFERABILITY

Recreational fishing licenses should be non-transferable.

3.1.6 LICENCE ELIGIBILITY RESTRICTIONS

Regarding the potential eligibility requirements surrounding a RF licence, few Mediterranean countries currently legislate on who can be issued such licences and under which conditions.

For spearfish activities, a sworn statement should be provided stating that the minimum health requirements are met to carry out this fisheries practice in secure way. For those under 16 years of age,

16

these statements, together with permission to practice this activity, should be signed by the parents or legal guardian.

The standardisation of licencing requirements, while taking local resource issues into account, should lead to the Mediterranean EU Member States devising a system of mutually-recognized RF licences together with a protocol to exchange relevant data among EU Member States issuing these licenses.

3.1.7 LICENCE ISSUING INSTITUTION

In general, the relevant legislation should identify the level of involvement and therefore the competent institution to issue RF licences, whether falling within the mandate of national ministries or local level governments, and the relative department: fisheries, tourism, sport etc.

3.2 CONSERVATION MEASURES

This section examines the various conservation measures to make recreational fisheries sustainable in accordance with basic principles of rational use of marine resources. They included traditional measures, such as limitation of fishing gears, implementation of catch size limits, prohibited species and specific measures for recreational fisheries, such as the adoption of harvest limits.

Under normal circumstances, marine recreational fishers should be able to make a reasonable catch for home consumption by means of a leisure activity which is sustainable for the environment and which provides, on the other hand, social and economic benefits for local communities. Recreational fishing can select targets or release the specimens caught alive when they are not the target of the fisheries (juveniles, specimens that do not meet the minimum landing size and, in general, those that cannot be landed, including protected species).

3.2.1 CATCH AND RELEASE

Catch and Release can be defined as the release of live fish in the water after being caught.

The release of live fish in recreational fisheries is common practice, either due to legal obligations (undersized or protected fish species) or as a voluntary act. These releases are – and should continue to be – seen as a positive contribution to conservation. This practice is also commonly used to support scientific research (i.e. tagging projects).

Catch and release is not a fishing method or modality in itself but a management tool with the objective of selective harvesting. Studies should be implemented to assess survival rates for different species, fishing techniques and gears.

3.2.2 LIMITATIONS ON FISHING METHODS AND GEAR

Restrictions on gears are common technical measures to avoid the increase of or to decrease fishing effort as well as to minimize the impact of fisheries activities on species or habitats. “Gear restrictions **have an**

important role to play in making optimal use of a stock or a resource” even if, when used alone, they do not ensure sustainability (FAO, 1997a).

3.2.2.1 HOOK LIMITATIONS

The least damaging technology available at any time should be used. For example:

1. with natural bait, single hooks should always be used;
2. the use of circle hooks should be encouraged with live and dead bait because it reduces deep hooking;
3. artificial lures with double or treble hooks may be allowed;
4. barbless hooks should be utilized whenever possible (in particular when there might be a risk of catching juveniles or catch and release is planned to be carried out) as it simplifies release;
5. a maximum hooks number (single, double, treble) per gear should be set.

3.2.2.2 SHORE BASED FISHING LIMITATION

At European level, Council Regulation (EC) No. 1967/2006 stated in Article 17 Paragraph 1 that “the use of towed nets, surrounding nets, purse seines, boat dredges, mechanised dredges, gillnets, trammel nets and combined bottom-set nets shall be prohibited for leisure fisheries”.

RAC MED would like to see this ban extended gradually to passive gears, incorporating in the meantime the clause that the Member States can authorize and regulate the use of traditional gears in specific situations.

A maximum number of gears per fisher being implemented at any one time should be set. We suggest a maximum number of two gears in action per fisherman. Limitation on hooks number (we suggest four) per gear should also be established.

3.2.2.3 VESSEL BASED FISHING LIMITATION

At European level, the Council Regulation (EC) No. 1967/2006 stated in Article 17 Paragraph 1 that “the use of towed nets, surrounding nets, purse seines, boat dredges, mechanised dredges, gillnets, trammel nest and combined bottom-set nets shall be prohibited for leisure fisheries”.

RAC MED would like to see this ban extended gradually to passive gears, incorporating in the meantime the clause that the Member States can authorize and regulate the use of traditional gears in specific situations.

A maximum number of gears per fisher being implemented at any one time should be set as well as a maximum number of gears per vessel. We suggest a maximum number of two gears in action per fisher with a maximum of six gears in action per vessel. Limitation on the number of hooks (we suggest four) per gear should also be established.

A limitation on the maximum power for electric reels should be set (we suggest 300W).

3.2.2.4 SPEARFISHING LIMITATION

The principal limitation of spearfishing is included its definition:

Recreational fishing activity practiced by free-diving techniques, without mechanical or respiratory assistance.

Spearfishing should be practiced with mechanically propelled spear guns (rubber/latex slings or compressed gas pneumatic powered spear guns) using only the fisher's own strength.

3.2.2.5 SHELLFISH HARVEST LIMITATION

The use of disruptive fishing gears such as shellfish dredges, rakes or trawls should be regulated and eventually banned to protect the benthic habitats.

3.2.3 HARVEST REGULATION

In order to protect juveniles, big spawners, threatened species and/or to achieve specific management goals, a harvest regulation should be set.

A minimum landing size should be set for all target species.

Taking into account the following FAO Technical Guidelines on Responsible Fisheries definitions, the RAC MED WG on Recreational Fisheries suggests:

(FAO) Harvest regulation: a fishing regulation that specifies what fish may be harvested (caught and kept) from a fishery, e.g. minimum size or daily bag limits

(FAO) Maximum size limit: a regulation in recreational fisheries where fish exceeding the size limit are to be released alive.

(FAO) Minimum size limit: a regulation in recreational fisheries where fish below the size limit are to be released alive.

(FAO) Slot limit: size-based fishing regulation in which only intermediate sized fish may be kept (open or protected slot) or must be released (closed or inverse slot)

(FAO) Bag limit: number of fish that may be retained by an individual over a specified time interval.

The minimum sizes adopted at EU level should not be set under the size of sexual maturity.

Harvest limits can be set both as a maximum number of specimens (i.e. bag limit) and/or as total weight (i.e. weight limit) allowed to be landed per person or per vessel, per day or per fishing trip, and always avoiding capture of juveniles, releasing them alive when incidentally caught.

A harvest limit could therefore include two or more species which could be retained legally respecting the total limit set in weight and/or number of specimens.

Generally in the Mediterranean the harvest limit is set in weight (e.g. 5 kg in Italy) to cover all retention allowed that day no matter what kind of species are landed. Such a global limit might be appropriate for control and enforcement but it is very rarely suitable for the protection of the resource or for optimal exploitation.

When operating with weight limitations as a harvest limit, it should always be considered that there may also be the need for a limitation in the number of specimens caught (for each or some species). A general weight limit alone, without number limitation, would not give appropriate protection to some of the smaller species (e.g. bream) or species with low or no minimum landing size (MLS).

In the same way, when operating with a limit measured in number of specimens (bag), the question should always be raised on the need to add a total weight limitation. A general number limit alone, without a maximum weight limit, would not give appropriate protection to some big spawners for which a size is not set. Furthermore, a regulation based on size (minimum, maximum, slot) should always be integrated with harvest limits. Moreover, in the case of spearfishing and to comply with a size limit (minimum, maximum, or slot), the fish, instead of being *released alive*, shall *not be caught*.

A “slot” limitation or a maximum catch weight per day (or trip) could be accompanied by an exemption for a “prize specimen” or “trophy specimen” (i.e. one single fish per day or trip), which exceeds the maximum length or the daily weight limit; bearing in mind that this makes good sense for some species but not always for others. It depends on a number of factors e.g. the overall management objectives and the risk status for that species.

TABLE 3 MINIMUM LANDING SIZES, ADOPTED IN THE EU MEDITERRANEAN REGULATION

BOX 4 (AS A REAL EXAMPLE): BAG LIMIT IN THE BASIC RECREATIONAL SALTWATER FISHING REGULATIONS FOR THE STATE WATERS OF FLORIDA

3.2.4 SHELLFISH HARVEST REGULATION

Shellfish should be regulated in a similar way as finfish (i.e. 3.2.3), therefore harvest limits set as bag limit and/or weight limit with minimum size, including season closures when needed, should be applied.

3.2.5 MARINE RESERVES

* GFCM definition of MPA: A marine reserve, park or other area protected from uncontrolled human access and use by application of various restrictions and activities, development and exploitation. They are defined as Marine Reserves, Parks or with other appellations depending on their characteristics.

Recreational fisheries may play an important socio-economic role in coastal regions. As such, management measures within Marine Protected Areas* (MPAs) always need to be taken in accordance with the specific

environmental impact on living aquatic resources and their habitats of each of the different fishing activities, having as main goal to keep or improve the conservation status of the marine ecosystems.

3.2.6 TEMPORAL RESTRICTIONS

Temporal restrictions may be useful technical measures that may help to protect components of a stock or communities such as spawning adults or juvenile stages.

Enough research programmes should be funded to comprehend the composition and state of target stocks.

3.2.7 OTHER RECREATIONAL FISHING REQUIREMENTS AND RESTRICTIONS

Some Mediterranean countries that have adopted RF regulations included measures providing for some general requirements or restrictions. They were practically the same in all the countries.

3.2.7.1 REQUIREMENTS IN RELATION WITH ACTIVITIES AND PASSIVE COMMERCIAL FISHING GEARS

Appropriate measures should be adopted to avoid conflicts among different fishing sectors during fishing activities in order to ensure the fishers safety. It is also advisable to respect a certain distance from fixed or floating professional gears and their signs, to ensure safe navigation.

3.2.7.2 PROXIMITY TO AQUACULTURE FACILITIES AND FARMS

This measure would minimize the interactions between aquaculture facilities, farms and recreational fisheries. It is also advisable to respect a certain distance from aquaculture facilities and farms, to ensure safe navigation and prevent non-authorized fishing.

3.2.7.3 AGGRESSIVE SUBSTANCES

Narcotics, chemicals, explosives, contaminants or poisonous substances should be forbidden for all fishing activities.

3.2.7.4 LIGHT ATTRACTION

In general, the use of lights to attract fishes may be restricted, but the use of one lamp may be authorized for squid fisheries. (e.g. we suggest a maximum power of 100 W)

3.2.7.5 SPATIAL AND TEMPORAL LIMITS

In some seasons, recreational fisheries may share the same zones with other marine and coastal users. In this context, spatial and temporal restrictions may be applied to avoid conflict and satisfy all users.

3.2.7.6 SPECIFIC FOR SHORE-BASED FISHERIES

Fishing is often prohibited in harbours and access channels. The regulation in such areas should be evaluated on a case-by-case basis by local authorities and not set at national or EU level.

3.2.7.7 SPECIFIC FOR VESSEL-BASED FISHERIES

Vessel-based RF activities should be restricted to boats registered as recreational vessels only.

3.2.7.8 SPECIFIC FOR SPEARFISHING

For security reasons, each fisher should mark his position with a clearly visible flagged buoy (red, orange, yellow...) or flagged board without going further away from it than a 25 m radius. This buoy or board can be substituted by a boat with the ALPHA flag clearly visible.

When fishing by this method it should be forbidden to have the spear gun loaded out of the water. The following should also be forbidden:

- The use of light sources other than a torch;
- The use of capture instruments with explosive, electric or electronic tip;
- The use of hydro gliders (i. e. scooters) and similar vehicles;
- Carrying out this activity during the night, from sunset to sunrise.

3.3 TRACEABILITY

The fight against IUU fishing is an important goal of any fishing regulation. In order to combat illegal sales of RF catches, fish species of high economic value caught by RF should be subject to an identification system such as cutting part of the caudal fin, as required by the French regulation.

3.4 SPECIAL RECREATIONAL FISHERIES REGULATIONS

This section is dedicated to the RF activities which, by their particular nature, require separate regulation. The specific characteristics of sports fisheries (competitive fishing) and tourism-charter recreational fishing deserve a more detailed review of the regulations adopted for these particular sub-sectors.

3.4.1 SPORTS FISHING

Fishing competitions can have positive values: they can be an opportunity to promote social activities among people sharing the same interests, to improve relationship among recreational fishermen and local authorities or other institutional bodies, to spread conservation principles, to improve knowledge on RF techniques.

Given the fact that during official competitions catches are made in a relatively small space-time boundary, authorization from relevant authorities is necessary prior to the event.

Fisheries managers should make sure that strict control of fishing competitions is carried out, requiring that the organizers complete reports of the activity, i.e., spatial coordinates, date, modality, number of participants, quantities of fish caught, and species. A properly managed competition could be a valid tool for data collection. (*)

The fishing competition's organizer (individual or entity) should be responsible for compliance with the different authorizations required.

In sports fishery competitions, where target species subjected to a rebuilding programme are concerned, the practice of catch and release should be mandatory. Should this not be possible, those species should be banned.

In addition to the authorizations mentioned, the organizing entity has to establish an institutional framework which sets clear rules meeting ethical and sustainable fishery objectives. Occasionally some professional vessels are used for fishing competitions. In the context of fishing competitions, the sale or trade of the catches obtained should be prohibited.

3.4.2 TOURISM CHARTER RECREATIONAL FISHING

Tourism-charter recreational fishing is a growing activity in Mediterranean basin often framed by a poor regulatory framework.

In order to fill the existing gap regarding tourism charter recreational fishing, complementary regulations for the commercial development of the activity should be established. These regulations should include issues such as authorizations, skipper requirements or vessel requirements that have to be applicable to and as close as possible to the Mediterranean EU legislation.

A properly managed tourism-charter recreational fishing sector could be a valid tool for data collection.

3.5 MONITORING AND CONTROL SYSTEMS (MCS)

The adoption of a monitoring, control and surveillance (MCS) system is necessary to ensure that fisheries policy in general, and the conservation and management arrangements for any specific fishery, are implemented fully and promptly. MCS operations encompass various activities such as the collection of catch data, fishing effort and inspections. The MCS should be tailored to the fisheries concerned, in our case recreational fisheries.

Without the appropriate implementation of a MCS, a recreational fisheries management scheme and control measures would be incomplete.

3.5.1 MONITORING AND CONTROL BODIES

Each Mediterranean EU Member State has a control body, potentially under a variety of ministries, in charge of maritime activities; therefore, the administrations responsible for the monitoring of RF vary across the basin. In some cases, several bodies were involved in the control of RF, such as port authorities and fisheries administrations.

In order to ensure a better monitoring and control, administrations involved in monitoring of RF could be helped by volunteers from recreational fishing associations or sport federations at national or local level, who should be properly trained.

Depending on the volume of fishing activity (including recreational), control bodies should implement a proportional control, being higher in those areas with greater activity.

3.5.2 MONITORING AND CONTROL MEASURES

According to Flewwelling (1994), monitoring can be defined as the “continuous requirement for the measurement of fishing effort characteristics and resource yields”. So, monitoring measures include data collection, analysis and diffusion.

As catch declarations are not required by the relative authorities, few monitoring programmes have been developed, with the exception of Bluefin tuna and swordfish. Catch declaration and vessel authorization for Bluefin tuna and swordfish fisheries are mandatory the EU Members States with a quota.

It would be desirable to see standardized monitoring measures for recreational fishing activities established throughout the Mediterranean basin.

3.5.2.1 INSPECTIONS

Inspection is a diffused monitoring method, at sea and/or ports/or coast, it is implemented for the control of both commercial and recreational fishing activities in the EU Mediterranean. The role of inspection at sea by the control bodies is to verify the vessel’s documentation, fishing gears and the catch retained on board. The role of the inspection in ports or on shore includes similar verifications.

In order to carry out stricter and more effective inspection, and to fight against IUU fishing, we would recommend that random inspections be carried out (in terms of place and time), including the trade chain (e.g. in restaurants).

3.5.2.2 INFRACTIONS AND SANCTIONS

Sanctions are often used as deterrents to law breaking and may take the form of the payment of fees/fines, disqualification from fishing activities (permanently or otherwise), seizure of products obtained illegally, confiscation of fishing gears, seizure of the vessel, cancellation or non-renewal of licences and so on.

It would be desirable to see all member States implementing a proper recreational fisheries sanction system, which includes a clear identification of all possible sanctions and infractions and proportionate fees/fines and deterrents for each of them.

3.6 REPORTING, SCIENTIFIC STUDIES

According to the European Commission, “particular attention should be given to set up a control and reporting framework for recreational fisheries, either targeting shared and straddling stocks or competing with commercial fisheries which are subject to strict technical rules” (COM (2002) 535 final).

Data collection, both biological and socio-economic, regarding RF activities is an integral part of RF management. Such information would allow for a deeper understanding of the impact of RF on the main resources as well as its socio-economic value to the local and national economies. Equally important as the information itself are the ways in which the data are collected and how they are used in scientific studies and RF management.

Involving stakeholders in the collection and use of RF information will increase not only the transparency of management but will probably lead to more readily-available information as stakeholders will see the utility of providing information for management.

Since December 2006, EU “Members States shall take measures both to record and to ensure separate collection of data on catches resulting from leisure fisheries in respect of the highly migratory species listed in Annex I to Regulation (EC) 973/2001165 and occurring in the Mediterranean” (Council Regulation (EC) No. 1967/2006).

Species concerned are:

Albacore: Thunnus alalunga, Bluefin tuna: Thunnus thynnus, Bigeye tuna: Thunnus obesus, Skipjack Katsuwonus pelamis, Atlantic bonito: Sarda sarda, Yellowfin tuna: Thunnus albacares, Blackfin tuna: Thunnus atlanticus, Little tuna: Euthynnus spp., Southern bluefin tuna: Thunnus maccoyii, Frigate tuna: Auxis spp., Oceanic sea breams: Bramidae, Marlins: Tetrapturus spp.; Makaira spp., Sailfish: Istiophorus spp., Swordfish: Xiphias gladius, Sauries: Scomberesox spp.; Cololabis spp., Dolphinfish; common dolphinfish: Coryphaena hippurus; Coryphaena equiselis, Sharks: Hexanchus griseus; Cetorhinus maximus; Alopiidae Rhincodon typus; Carcharhinidae; Sphyrnidae; Isuridae; Lamnidae.

There is no general system in EU Mediterranean Members States obliging the recreational fishers to declare catch levels. An appropriate data collection system should be applied to each recreational segment (charter, sport and leisure), discussed and agreed by managers, stakeholders and scientists, and taking in account context-dependent issues.

BOX 5 (AS AN EXAMPLE). RECREATIONAL FISHING DATA COLLECTION SYSTEM

3.7 EDUCATION, AWARENESS AND UNDERSTANDING

Communication and outreach of rights, rules and regulations to all fishermen is an essential element for the success of any legislative framework as ignorance or lack of comprehension of such rules has been proven to be a major factor in fishing infractions, especially in a rapidly changing sector in which superseding rules and enforcement measures keep being applied.

Teaching aids may take many forms (web pages, meetings, pamphlets, courses, etc), depending on the local culture; however obligations regarding regulations (e.g. minimal sizes, prohibited species, daily bag limits, gears allowed) must be widespread with all methods and economic support by public administrations.

Education and awareness should be carried out preferably with the joint collaboration of managers, stakeholders and scientists.

4 TABLES

TABLE 1 POTENTIAL TARGET SPECIES IN MEDITERRANEAN RECREATIONAL FISHERIES INCLUDED IN THE FAO REFERENCES

SCIENTIFIC NAME	FAO	ENGLISH	ESPAÑOL	ITALIANO	FRANÇAIS	FAMILY
<i>Alopias vulpinus</i>	ALV	Thresher	Pez zorro	Peze Volpe	Renard	Alopiidae
<i>Alosa alosa</i>	ASD	Allis shad	Sábalo común Alosa - Xagüeta - Arencon	Alosa	Alose vraie (=Grande alose)	Clupeidae
<i>Alosa fallax</i>	TSD	Twaite shad	Saboga - Alosa - Alacha	Cheppia	Alose feinte	Clupeidae
<i>Anguilla anguilla</i>	ELE	Eel	Anguila, Angula	Anguilla	Anguille	Anguillidae
<i>Anthias anthias</i>	AHN	Swallowtail seaperch	Tres colas	Monacella	Barbier hirondelle	Serranidae
<i>Apogon imberbis</i>	OGF	Cardinalfish	Alfonsito - Salmonete real - Funfurrña		Cardinal	Apogonidae
<i>Argyrosomus regius</i>	MGR	Meagre	Corvina	Bocca d'oro	Maigre	Sciaenidae
<i>Arnoglossus laterna</i>	MSF	Mediterranean scaldfish	Serradell - Peluda	Suacia	Fause limande - Arnoglosse imperial	Bothidae
<i>Atherina boyeri</i>	ATB	Big-scale sand smelt	Pejerrey	Latterino	Joël	Atherinidae
<i>Atherina hepsetus</i>	AHH	Mediterranean sand smelt	Chucleto	Latterino	Joël - Siouclet	Atherinidae

Atherina presbyter	ATP	Sand smelt	Abichón- Sugla - Xugla		Prête	Atherinidae
Aulostomus strigosus	AGQ	Trumpet fish	Pez trompeta		Poisson Trompette	Aulostomidae
Auxis rochei = Auxis thazard	BLT	Frigate tuna - Bullet tuna	Melva - Melvera	Tombarello	Bonitou - Auxide - Melva - Bise	Scombridae
Balistes carolinensis	TRG	Triggerfish	Pez ballesta- Pejepuerco blanco - Gallo cochino - Escopeta	Pesce Balestra	Baliste	Balistidae
Belone belone	GAR	Garfish	Aguja	Aguglia	Orphie - Aiguille	Belonidae
Blenniidae	BLE	Blennie	Babosa		Baveuse	Blenniidae
Boops boops	BOG	Bogue	Boga Torillo - Flora - Gallerbo - Moma - Fraile		Bogue	Sparidae
Bothus podas	OUB	Wide-eyed flounder	Podas Tapaculo		Rambou podas - Rhombou	Bothidae
Brama brama	POA	Atlantic pomfret	Japuta - Palometa - Pampano chico	Pesce castagna	Grande castagnole - Brème de mer	Bramidae
Capros aper	BOC	Boarfish	Ochavo		Sanglier	Caproidae
Carcharhinus plumbeus	CCP	Sandbar shark	Jaquetón		Requin gris	Carcharhinidae
Carcharodon carcharias	WSH	Great white shark	Tiburón blanco	Squalo bianco	Grand requin blanc	Lamnidae
Cheilopogon heterurus	ECE	Gray flying fish	Juriola	Rondinella	Poisson volant	Exocoetidae
Chelidonichthys lastoviza	CTZ	Streaked gurnard	Rubio		Grondin	Triglidae
Chelon labrosus	MLR	Thicklip grey mullet	Lisa - Corcón - Lisote - Muil - Tabaga	Bosega	Mulet lippu	Mugilidae
Chromis chromis	CMK	Damselfish	Castañuela - Fula		Castagnole - Demoiselle	Pomacentridae
Citharus linguatula	CIL	Spotted flounder	Solleta - Palaya -	Linguattola	Feuille - Fausse limande	Citharidae
Conger conger	COE	Conger eel	Congrio	Congro	Congre	Congridae
Coris julis	COU	Rainbow wrasse	Doncella - Julia	Donzella	Girelle	Labridae
Coryphaena hippurus	DOL	Common dolphinfish	Lampuga - Dorado	Lampuga	Coryphène	Coryphaenidae

Ctenolabrus rupestris	TBR	Goldsinny-wrasse	Tabernero		Rouquié	Labridae
Dactylopterus volitans	DYL	Flying gurnard	Golondrina Chicharra		Grandin volant	Dactylopteridae
Dasyatis pastinaca	JDP	Common stingray	Chucho Pastinaca		Pastenague commune	Dasyatidae
Dentex dentex	DEC	Dentex - Toothhead bream	Dento- Sama de rey - Machote	Dentice	Denté	Sparidae
Dentex gibbosus	DEP	Pink dentex	Pargo - Sama de pluma	Dentice corassiere	Gros denté rose - Pagne royal	Sparidae
Dentex macrophthalmus	DEL	Large-eye dentex	Cachucho		Denté à gros yeux	Sparidae
Dicentrarchus labrax	BSS	Sea bass	Lubina - Róballo - Roballiza - Furagaña - Chova	Branzino	Bar - Loup	Moronidae
Dicentrarchus punctatus	SPU	Spotted seabass	Baila - Rayela	Spigola macchiata	Bar tacheté	Moronidae
Diplodus annularis	ANN	Annular bream - Sabaris	Raspallón - Amarillo - Esparrallón - Tena - Chapa	Sparaglione	Sparaillon - Pataclet - Petit sargue	Sparidae
Diplodus cervinus	SBZ	Zebra seabream	Sargo real - Sargo soldado - Bizcuervu Sargo breado -		Sar à grosses lèvres - Tambour	Sparidae
Diplodus puntazzo	SHR	Sharpsnout seabream	Sargo picudo - Morruda	Sarago pizzuto	Sar à museau pointu	Sparidae
Diplodus sargus	SWA	White seabream	Sargo Jargo - Xapeta - Xargu	Sarago maggiore	Sar commun - Sargue	Sparidae
Diplodus vulgaris	CTB	Two-banded seabream	Mojarra Vidriada - Seifía - Sargo burdo - Xargu	Sarago fasciato	Sar à tête noire - Varade - Sar doré	Sparidae
Epinephelus alexandrinus			Falso abadejo			
Epinephelus marginatus	GPD	Dusky grouper	Mero	Cernia	Mérou	Serranidae
Euthynnus alletteratus	LTA	Little tunny	Bacoreta - Bonito zurdo - Albacoreta	Tonnetto	Thonine	Scombridae
Gaidropsarus mediterraneus	GGD	Shore rockling	Bertorella	Motella	Motelle de Méditerranée	Gadidae
Galeorhinus galeus	GAG	Tope shark	Cazón	Bistinu	Requin-hâ	Triakidae

Galeus melastomus	SHO	Blackmouth catshark	Pintarroja bocanegra Olayo - Bocanegra - Baquia - Golay		Chien espagnol	Scyliorhinidae
Gobius cobitis	GBC	Giant goby	Cabote - GobioCabot de roca		Gobie a grosse tête	Gobiidae
Gobius niger	GBN	Black goby	Chaparrudo - Caboso		Gobie noir	Gobiidae
Gobius paganellus	GON	Rock goby	Bobi		Gobie	Gobiidae
Helicolenus dactylopterus	BRF	Blackbelly rockfish - Blue mouth	Gallineta Boca negra - Pollico - Cabrallocha	Scorfano di fondale	Rascasse du nord - Chèvre - Badasco	Scorpaenidae
Heptranchias perlo	HXT	Sharpnose sevengill shark	Cañabota bocadulce Boquidulce - Alcatrinya		Requin perlon	Hexanchidae
Hexanchus griseus	SBL	Bluntnose sixgill shark	Cañabota gris - Albajar		Requin griset	Hexanchidae
Istiophorus albicans	SAI	Atlantic sailfish	Pez vela		Voilier de l'Atlantique	Istiophoridae
Isurus oxyrinchus	SMA	Shortfin mako	Marrajo - Mako	Squalo mako	Taupe bleue	Lamnidae
Katsuwonus pelamis=Euthynnus pelamis	SKJ	Skipjack tuna	Listado - Bonito vientre rallado - Sierra - Futbolista - Alistado	Tonnetto listato	Bonite ventre rayé	Scombridae
Labrus bergylta	USB	Ballan wrasse	Maragota Zapatero - Botona - Pinto - Romero - Durdo		Vieille commune	Labridae
Labrus bimaculatus	USI	Cuckoo wrasse	Gallano	Tordo fischietto	Vieille coquette	Labridae
Labrus merula	WRM	Brown wrasse	Merlo - Tordo negro - Bodi6n	Tordo nero	Merle	Labridae
Lamna nasus	POR	Porbeagle	Marrajo sardinero	Smeriglio	Requin-taupe commun	Lamnidae
Lepadogaster lepadogaster	GLP	Shore clingfish	Chafarrocas		Barbier	Gobiesocidae
Lepidopus caudatus	SFS	Degenfish	Pez cinto Sable - Pejesable	Pesce sciabola	Sabre argenté	Trichiuridae

Lepidorhombus boscii	LDB	Megrin	Gallo	Rombo quattrocchi	Cardine - Fausse limande	Scophthalmidae
Lichia amia	LEE	Leerfish - Vadigo	Palometón - Lirio	Leccia	Liche	Carangidae

TABLE 3 MINIMUM LANDING SIZES, ADOPTED IN THE EU MEDITERRANEAN

REGULATION

SCIENTIFIC NAME	COMMON NAME	Minimum size
1. Fishes		
Dicentrarchus labrax	Sea-bass	25 cm
Diplodus annularis	Annular sea-bream	12 cm
Diplodus puntazzo	Sharpsnout sea-bream	18 cm
Diplodus sargus	White sea-bream	23 cm
Diplodus vulgaris	Two-banded sea-bream	18 cm
Engraulis encrasicolus	* European anchovy	9 cm
Epinephelus spp.	Groupers	45 cm
Lithognathus mormyrus	Stripped sea-bream	20 cm
Merluccius merluccius	*** Hake	20 cm
Mullus spp.	Red mullets	11 cm
Pagellus acarne	Spanish sea-bream	17 cm
Pagellus bogaraveo	Red sea-bream	33 cm
Pagellus erythrinus	Common pandora	15 cm
Pagrus pagrus	Common sea-bream	18 cm
Polyprion americanus	Wreckfish	45 cm
Sardina pilchardus	** European sardine	11 cm
Scomber spp.	Mackerel	18 cm
Solea vulgaris	Common sole	20 cm
Sparus aurata	Gilt-head sea-bream	20 cm
Trachurus spp.	Horse mackerel, Scad	15 cm

(*) Anchovy: Member States may convert the minimum size into 110 specimens per kg;

(**) Sardine: Member States may convert the minimum size into 55 specimens per kg;

(***) Hake: Nevertheless, until 31 December 2008 a margin of tolerance of 15 % of weight will be permitted for hake between 15 and 20 cm. This tolerance limit shall be complied with by both individual vessels, at sea or at the place of landing, and at the markets of first sale after landing. This limit shall also be complied with in any subsequent commercial transaction at national and international level

FISH - Name and Size				Daily bag limit
Scientific name	Common name	Minimum landing size	Maximum landing size, when appropriate	Number of fish/day (fisherman/boat)

BOX 2 (AS AN EXAMPLE): ECONOMIC VALUATION TECHNIQUES FOR RECREATIONAL FISHERIES

Current economic valuation techniques can be divided into three sub-categories:

1) Revealed-preference approaches:

Travel cost: Valuations of site-based amenities are implied by the costs people incur to enjoy them (e.g. improved sport fishing activities, fishing tour).

Market methods: Valuations are directly obtained from what people may be willing to pay for the service or goods (e.g. eco-labelling price differentials, increased value of a fishery).

Hedonic methods: The value of a service is implied by what people will be willing to pay for a service through purchases in related markets, such as housing markets (e.g. recreational vessel purchases, housing purchases on coastal areas and waterfronts).

Production approaches: Service values are assigned from the impacts of those services on economic outputs (e.g. increased efficiency from by catch reduction methods, improved CPUE in a fishery).

2) Stated-preference approaches:

Contingent valuation: People are directly asked their willingness to pay or accept compensation for some change in ecological service (e.g. coastal reef preservation, endangered species protection).

Conjoint analysis: People are asked to choose or rank different service scenarios or ecological conditions that differ in the combination of the conditions (e.g. MPA with varying levels of permitted human activities).

3) Cost-based approaches:

Replacement cost: The loss of a natural system service is evaluated in terms of what it would cost to replace that service (e.g. alternative coastal livelihoods).

Avoidance cost: A service is valued on the basis of costs avoided, or extent to which it allows the avoidance of costly averting behaviours, including mitigation (e.g. participatory fisheries management reduces conflicts, health benefits of fish products).

BOX 4 (AS A REAL EXAMPLE): BAG LIMIT IN THE BASIC RECREATIONAL SALTWATER FISHING REGULATIONS FOR STATE WATERS OF FLORIDA

Basic recreational saltwater fishing regulations for state waters of Florida

This brief summary of regulations governs the taking of saltwater species in Florida state waters for personal use. It is not applicable to the commercial harvesting of these species. The absence of complete laws, rules and regulations in this summary does not relieve persons from compliance with those laws, rules or regulations. **State waters extend to 3 nautical miles on the Atlantic and 9 nautical miles on the Gulf. Federal rules apply beyond state waters unless expressly stated otherwise. For species that do not have an established bag limit, more than 100 pounds or two fish per harvestor per day (whichever is greater), is considered commercial quantities.** A saltwater produce license and commercial vessel registration are required to harvest commercial quantities of unregulated species. It is illegal to sell recreationally harvested fish without compliance with commercial license requirements. Issue Forty One, July 2012. Highlights indicate recent regulation changes.

Species	Minimum Size Limits	Closed Seasons	Daily Rec. Bag Limit	Remarks
Amberjack, Greater ▲ ●	28" fork Atlantic; 30" fork Gulf	June 1 - July 31 Gulf of Mexico	1 per harvestor per day	
Amberjack, Lesser & Banded Rudderfish ▲ ●	Not less than 14" or more than 22" fork		5 aggregate of lesser amberjack and banded rudderfish	
Bilfish ▲	SeaFish 63" Blue Marlin 99" White Marlin 66" Roundnose Spearfish 66"		1 per harvestor per day aggregate bag limit	Measured tip of lower jaw to fork. All landed fish must be reported to NOAA within 24 hours 800-854-6028 or htrpermits.noaa.gov . HMS permit required in federal waters.
Black Drum ▲ ♀ T	Not less than 14" or more than 24"		5 per harvestor per day	May possess one over 24". Snatching prohibited.
Bluefish ▲	12" fork		10 per harvestor per day	
Bonneton			0 per harvestor per day	Catch and release only. Hook and line gear only
Clams (Hard)	3" thick across hinge	May not harvest half hour after official sunset until half hour before official sunrise	One 5 gal. bucket per harvestor or 2 per vessel, whichever is less per day (whole in shell)	Illegal to harvest from closed areas. Go to www.floridasquaculture.com for allowable harvesting areas.
Cobia (Ling) ▲	33" fork		1 per harvestor or 5 per vessel per day, whichever is less	
Crab, Blue		Sept. 20 - Oct. 4 Gulf state waters beyond 3 miles closed to traps, federal waters closed to traps. Regional trap closures apply	10 gallons whole per harvestor per day	5 traps maximum. Trap requirements apply. Harvest of egg-bearing crabs prohibited.
Crab, Blue Land		July 1 - Oct. 31	30 per harvestor per day	Trapping prohibited, harvest of egg-bearing females prohibited, harvest prohibited in state parks and from the right-of-way of federal, state or county maintained roads.
Crab, Stone	2 1/4" claw	May 15 - Oct. 14	1 gal. Stone Crab claws per harvestor or 2 gal. per vessel, whichever is less	5 traps maximum. Trap requirements apply. Illegal to possess whole crab. Harvest of egg-bearing crabs prohibited.
Dolphin ▲	20" fork Atlantic		10 per harvestor per day, not to exceed 50 per vessel per day	
Flounder ▲ ♀ T	12"		10 per harvestor per day	May be harvested by spearing. Snatching prohibited.
Gag ▲ ♀ ●	24" Atlantic & Monroe County 22" Gulf (excluding Monroe County)	State waters of Gulf (except Franklin, Wakulla, Jefferson & Taylor) OPEN July 1, 2012 and CLOSED on Nov. 1, 2012. State waters off Franklin, Wakulla, Jefferson, Taylor are CLOSED July 1, 2012 - June 30, 2013. Atlantic & Monroe County CLOSED Jan. 1 - April 30	1 per harvestor per day Atlantic & Monroe County. 2 per harvestor per day Gulf (excluding Monroe County)	No more than 1 fish may be Gag or Black Grouper, either individually or in combination in Atlantic & Monroe County. Included within the 3 per harvestor per day (Atlantic & Monroe County) and 4 per harvestor per day (Gulf excluding Monroe County) Grouper aggregate bag limit. Zero daily bag and possession limit for captain & crew on for-hire vessels. Please check back with MyFWC.com for the latest updates.
Grouper, Black ▲ ♀ ●	24" Atlantic & Monroe County 22" Gulf (excluding Monroe County)	Closed in Gulf (excluding Monroe County) Feb. 1 - March 31 Closed Atlantic & Monroe County Jan. 1 - April 30	1 per harvestor per day Atlantic & Monroe County. 4 per harvestor per day Gulf (excluding Monroe County)	
Grouper, Red ▲ ♀ ●	20"	Closed Atlantic & Monroe County Jan. 1 - April 30	3 per harvestor per day Atlantic & Monroe County. 4 per harvestor per day Gulf (excluding Monroe County)	Included within the 3 per harvestor per day (Atlantic & Monroe County) and 4 per harvestor per day (Gulf excluding Monroe County) Grouper aggregate bag limit. Zero daily bag and possession limit for captain & crew on for-hire vessels.
Grouper, Snowy ▲ ●		Closed in Gulf (excluding Monroe County) Feb. 1 - March 31	1 per harvestor per day Atlantic	
Grouper, Yellowfin & Yellowmouth ▲ ♀ ●	20"	Closed Atlantic & Monroe County Jan. 1 - April 30		
Grouper, Scamp ▲ ♀ ●	20" Atlantic & Monroe County, 16" Gulf (excluding Monroe County)	Closed Atlantic & Monroe County Jan. 1 - April 30		
Grouper, Wicawaw & Speckled Hind ▲ ●			1 per vessel per day of each species	Included within the 3 per harvestor per day (Atlantic & Monroe County) and 4 per harvestor per day (Gulf excluding Monroe County) Grouper aggregate bag limit. Atlantic & Monroe County: Zero daily bag and possession limit for captain and crew on for-hire vessels.
Grouper, all others ▲ ●		Closed in Gulf (excluding Monroe County) Feb. 1 - March 31 for Rock Hind and Red Hind Closed Atlantic & Monroe County Jan. 1 - April 30 for Tiger, Rock Hind, Red Hind, Coney, Girembly		
Hogfish ▲ ●	12" fork		5 per harvestor per day	
Mackerel, King ▲	24" fork		2 per harvestor per day	Bag limit reduced to 1 in some state waters when federal waters are closed to all harvest.
Mackerel, Spanish ▲	12" fork		15 per harvestor per day	Transfer of Spanish Mackerel to other vessels at sea is prohibited.
Mullet, Striped (Black) & Silver			50 aggregate per harvestor per day. Aggregate vessel limits Feb. 1 - Aug. 31: 100 per vessel; Sept. 1 - Jan. 31: 50 per vessel	Mullet aggregate bag limit includes Striped and Silver. Call DMFM for additional restrictions in Pinellas and Charlotte counties.
Oysters	3"	June, July, Aug. in Dixie, Wakulla, Levy counties July, Aug., Sept. in all other areas	2 bags per harvestor or vessel, whichever is less per day. 1 bag = 60 lbs. or two 5 gal. buckets (whole in shell)	Apalachicola Bay has summer & winter seasons/waves. Harvest from approved shellfish areas only. Go to Floridasquaculture.com for allowable harvesting areas.
Permit ▲ T	22" fork SPZ. Not less than 11" or more than 22" fork all other areas	May 1 - July 31 SPZ Only	1 per harvestor per day, not to exceed 2 per vessel per day SPZ 2 per harvestor per day all other state waters	May possess 1 over 22" fork length in all other areas, not to exceed 2 over 22" fork per vessel per day. See page 11 for gear restrictions. For map of SPZ, please see: MyFWC.com/Fishing/Saltwater/Regulations/Permit .
Pompano, Florida ▲ T	11" fork		5 per harvestor per day	Hook and line, cast net, and beach or haul seine ONLY.
Pompano, African ▲ T	24" fork		2 per harvestor per day, not to exceed 2 per vessel per day	

BOX 5 (AS AN EXAMPLE): RECREATIONAL FISHING DATA COLLECTION SYSTEM

Each one of the recreational fishing sectors requires different systems:

For tourism charter recreational fishing, since a professional skipper intervenes in these activities, collection of data of captures can be made per fishing day.

For sport fishing (competitions) as these activities should have a person or organizing entity which has been authorized to develop the competition, data collection concerning captures can be made per competition.

For leisure fishing, as the number of actors in the monitored area is known, in order to gain knowledge of the effort applied, we should have three regular inputs:

- 1) Information gathered by voluntary members of the collaborating stakeholder groups.
- 2) Landing statistics in the recreational harbours, not to be confused with inspections.
- 3) Recreational fishing activity carried out under the supervision of technicians from fishing administrations or collaborating scientific institutions.

With these three inputs a model can be made with high reliability results.

6. MINORITY STATEMENTS

3.1.1.4 SPORTs FISHING LICENSE

From the point of view of the fishing administration, the recreational fishing licenses should be enough for the development of the recreational sport fishery sector activities.

IFSUA minority statement

Sport licenses have been issued by fishing federations for more than 70 years (and are still being issued). These federations require this license to allow participation in regional, national and international championships. Governments may, in addition to these official competitions, allow other kind of contests outside this framework and require contestants to hold recreational fishing licenses only.

Sport licensing is an excellent tool to make an effective biological and socio-economic assessment of fishing competitions. In this context, and to make assessment more reliable, it would be desirable that this license be issued by fishing method. In addition to sport licenses, organizers should require participants to hold recreational fishing licenses too.

3.2.5 MARINE RESERVES

* GFCM definition of MPA: A marine reserve, park or other area protected from uncontrolled human access and use by application of various restrictions and activities, development and exploitation. They are defined as Marine Reserves, Parks or with other appellations depending on their characteristics.

Recreational fisheries may play an important socio-economic role in coastal regions. As such, management measures within Marine Protected Areas* (MPAs) always need to be taken in accordance with the specific environmental impact on living aquatic resources and their habitats of each of the different fishing activities, having as the main goal, keeping or improving the conservation status of the marine ecosystems.

Minority Statement, IFSUA, FIPS-M and FIPSAS.

(*) Therefore, before prohibiting any recreational fishing activity within MPAs, managers should make every effort to ensure that no other management tools can be applied to achieve the same conservation goals.

3.4.1 SPORT FISHING

Fishing competitions can have positive values: they can be an opportunity to promote social activities among people sharing the same interests, to improve relations among recreational fishermen and local authorities or other institutional bodies, to spread conservation principles, to improve knowledge on RF techniques.

Given the fact that during official competition catches are made in a relatively small space-time boundary, prior authorization from relevant authorities is necessary.

Fisheries managers should make sure that strict control of fishing competitions is carried out, requiring that the organizers complete reports of the activity, i.e., spatial coordinates, date, fishing method, number of participants, quantities of fish caught, and species. A properly managed competition could be a valid tool for data collection. (*)

The fishing competition organizer (individual or entity) should be responsible for the compliance with the different authorizations required.

In sport fishing competitions, for target species subjected to a rebuilding programme the catch and release practice should be mandatory. Should this not be possible, those species should be banned.

In addition to the previously mentioned authorizations, the organizing entity has to establish an institutional framework which sets clear rules ensuring ethical and sustainable fisheries.

Occasionally some professional vessels are used for fishing competitions.

In fishing competitions sale or trade of catches obtained should be prohibited.

Minority Statement, FIPS-M and FIPSAS

() A properly managed competition could be a valid tool for data collection, with this aim, official Sport Federations or Organizations should be preferred as organizers because they are able to ensure correct data collection.*

BOX 5 (AS AN EXAMPLE). RECREATIONAL FISHING DATA COLLECTION SYSTEM

Minority Statement, IFSUA, FIPS MER and FIPSAS

Delete box 6, The data collection system should be discussed for each segment and context.
